+ b

1. (5 points) A sugar patient records his daily Blood Glucose levels in the morning before samples of the dataset with food items he had on the previous nights. Being a data scientist, he developed and trained a simple linear model. Eventually, he settled with the following model $(x) = 5.8x_1 + 3.4x_2 + 20.9x_3 + 1.2x_4 + 79.8$ to predict the glucose level.

_	<u> </u>			
Idli (x_1)	$Dosa(x_2)$	Ice $Cream(x_3)$	Slept by 11 p.m (x_4)	Level (mg/dL)
:		<u> </u>		
1	1	1	1 (Yes)	113.4
0	4	0.5	1 (Yes)	106.1
1	2	0	-1 (No)	92.2
:	:	:	-	:

One fine day, he had three Idli, two Dosa, one Ice cream and continued working beyond 11 p.m. to submit the MLF assignment. On the next day he found the actual glucose level was at 118.2 mg/dL. Then, he used the trained model to predict the glucose level. The squared error between the model's prediction and the actual level would be?

f(1) = 5.8 x, t3.4 x, t20.9 x, = =	, t l 2264 t 79. S
$f_{\rho}(\alpha) = 5.8(3) + 3.4(2) + 20.9($	1) t1,2(-1)
tag	.\$.

fp(x) = (23.7

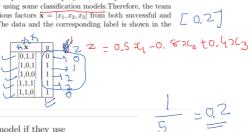

$$x_1 = 3$$
 $f(x) = 118,2 my$
 $x_2 = 2$
 $x_3 = 1$
 $x_4 = -1$

$$loss = . - f_a(x)$$

$$= (123.7 - 116.2)^2$$

$$loss = 30.25$$

2. (5 points) The ML team in a movie production company wanted to predict whether a movie will be successful or not by using some classification models. Therefore, the team collected presence/absence of various factors $\mathbf{x} = [x_1, x_2, x_3]$ from both successful and unsuccessful movies in the past. The data and the corresponding label is shown in the table below. table below.

Compute the loss of the model if they use

$$u(z) = \begin{cases} 1, & \text{if } z \ge 0 \\ \underline{0}, & \text{otherwise} \end{cases}$$

and $z = 0.5x_1 - 0.8x_2 + 0.4x_3$

3. (5 points) The dimensionality of the data points shown in the table is to be reduced from \mathbb{R}^3 to \mathbb{R} . To achieve it the following encoder function $f(\underline{x}_1, x_2, x_3) = \frac{2x_1 - x_2}{2}$ and the corresponding decoder function g(u) = [u, 2u, 3u] is proposed .Compute the loss (or reconstruction error) of the proposed model $\stackrel{\square}{=}$

0.5tu.4729

4. (5 points) Consider the following table that shows the data points (x) and two possible distributions $(P_1(x), P_2(x))$ which might have generated those data points

x	$P_1(x)$	$P_2(x)$
0.2	1/6	0.5
0.4	<u>i</u>	0.2
0	¥	0.1
-0.2	\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	0.1
-0.4	1 4	0.05
0.1	1 1	0.05

Rohan argues that the data points are most likely generated by $P_1(x)$. Let L_1 be the loss for $P_1(x)$ and L_2 be the loss for $P_2(x)$. Verify his claim by computing the average loss for both distributions and enter the difference $L_1 - L_2$.

Loss = +1 & (- loge(Pilx) $L_2 = -\frac{1}{2} \left[-\log\left(\frac{1}{2}\right) - \log\left(0.2\right) \right]$

For both distributions and enter the difference
$$L_1 - L_2$$
.

$$L_1 = \frac{1}{6} \left[-\log\left(\frac{1}{6}\right) + \left(-\log\left(\frac{1}{6}\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) \right]$$

$$= \frac{1}{6} \left[-6\log\left(\frac{1}{6}\right) + \left(-\log\left(\frac{1}{6}\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) \right]$$

$$= \frac{1}{6} \left[-6\log\left(\frac{1}{6}\right) + \left(-\log\left(\frac{1}{6}\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) \right]$$

$$= \frac{1}{6} \left[-6\log\left(\frac{1}{6}\right) + \left(-\log\left(\frac{1}{6}\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) \right]$$

$$= \frac{1}{6} \left[-6\log\left(\frac{1}{6}\right) + \left(-\log\left(\frac{1}{6}\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+ -+\left(-\log\left(\frac{1}{6}\right)\right) + -+ -+ -\log\left(\frac{1}{6}\right) + -+ -\log\left(\frac{1}{6}\right) \right) \right]$$

$$= \frac{1}{6} \left[-6\log\left(\frac{1}{6}\right) + \left(-\log\left(\frac{1}{6}\right) + -+\left(-\log\left(\frac{1}{6}\right)\right) + -+ -\log\left(\frac{1}{6}\right) + -+ \log\left(\frac{1}{6}\right) + -+ \log\left(\frac{1}{6}\right) + \log\left(\frac{1}{6}$$

$$-2 \log(0.1) -2 \log(0.05)$$

$$= 2.14$$

$$L_1 - L_2 = 1.79 - 2.14$$

$$= -0.35$$

5. (2 points) Linear approximation of $f(x) = 5x^2 + 3x - 9$ around x=0.1 is y=0.9 for y=0.1 in y=0.1 is y=0.1 for y=0.1 in y=0.1

$$t(x) = 5x^{2} + 3x - 9$$
